Homework 1: Hello, World!

Hello, World! is the most common first website for aspiring web programmers. The website simply displays the text “Hello, World!” The code for this project is very simple.

The program is a PHP application that runs on a local machine host through Apache. The code

simply contains a header, which states the webpage title, “Greeting to the World.” The <body> tag contains the actual text of the webpage, “Hello, World!” This program has no other functionality, as evidenced by the lack of other code.

This project is useful for first-time programmers because of its simplicity. The code that alters the webpage is very easy to identify, making it easy to modify and personalize if the programmer should want. The lack of functionality is somewhat boring, but the overall learning experience is vital for first-time programmers.
