

This website displays the famous programming message “Hello, World!” The code is a combination of HTML and CSS language.

The HTML contains the “Hello, World!” text under the <body> tag. This displays the text at the top of the page. Under the <head> tag is the “Greeting to the World” text that appears in the title of the page on the tab.

The CSS provides most of the styling on the page. The text color is changed to a dark orange to

complement the ONU colors, as well as the dark black border surrounding the text. The font size is increased to 128 pixels and made oblique to better contrast against the background by use of the font-size and font-style commands.

The background itself is the ONU Polar Bear logo, tiled across the page. The background-image command accepts the URL address of the image, then the background-repeat command allows the image to tile infinitely across the page. If the image is ever unavailable for any reason, the background-color for the page is defaulted to white.

The HTML file links the formatting specifics of the CSS file using the <link> function. This permits all the background and text modifications of that file to be used by the webpage. The site is then hosted on the computer’s localhost, allowing the webpage to be accessed through Apache. The final result is shown in the image above.
